

Getting started

Cprime Apps has been rebranded as Anova Apps. Please note the only effect is the company name - all of our products' names, logos, functionalities, support, etc. is exactly the same. The new location to our documentation space is <https://anovaapps.atlassian.net>.

Simple Issue Language™

Simple Issue Language™ (SIL™) is an easy to learn scripting language (see SIL™ [syntax](#)) that is used by our certain apps.

Example

For example with SIL™ and Power Scripts™ for Jira app you can create a post-function that automatically creates a sub-task.

```
string projectKey= "TSTP";

string issueType = "Sub-task";
string issueSummary = "Issue created using SIL";
//create routine
issue = createIssue(projectKey, key, issueType, issueSummary);
```

See more examples [here](#).

Syntax

For the language syntax, check out the [syntax page](#).

Jira standard variables

SIL™ has a list of standard variables that you can use to change issues fields.

For example, to change the issue description you can use the standard variable description:

```
description = "Issue description";
```

Learn more about standard variables [here](#).

Routines

SIL™ comes with a library of standard routines to use in scripts. There are routines for handling arrays, strings, dates and there are specific app routines.

Learn more about SIL™ routines [here](#).

What's next

After you get started with SIL™, see details on [How it works](#).
